

26 Webinar
March 2026
10:00-11:30 CET

Navigating Climate Change: Methodologies and Applications for Conservation

Funded by
the European Union

NaturaConnect receives funding under the European Union's Horizon Europe research and innovation programme under grant agreement number 101060429

© Katriina Könönen

Welcome

Basic webinar guidance

- ✓ The webinar is being recorded.
- ✓ Write your questions and comments in the chat, indicating the speaker you address.
- ✓ All presentations, the recording and report will be available at [naturaconnect.eu/past events](https://naturaconnect.eu/past-events) and shared with registered participants.
- ✓ Feel free to rename and state your organisation by clicking on the three dots ... next to your name!
- ✓ Please start/stop your camera at your convenience :)

Agenda for today

- 1) **Brief introduction to NaturaConnect** – Hildegard Meyer (WWF Central and Eastern Europe)
- 2) **Introduction to climate-resilient planning & methodology** – Moreno Di Marco (Sapienza University of Rome)
- 3) **The NaturaConnect Methodology & applications for protected areas** – Marta Cimatti (Sapienza University of Rome)
- 4) **The NaturaConnect Learning Platform tutorial/practical application** – Valerio Mezzanotte (Sapienza University of Rome)
- 5) **Assessing forest vulnerability to drought and supporting adaptation strategies** – José Atauri, EUROPARC Spain
- 6) **ForestConnect project: Pilot actions to adapt to climate-driven food scarcity for large carnivores** – Maria Kachamakova, WWF Bulgaria
- 7) **Open discussion & closing of the webinar** – Hildegard Meyer (WWF-CEE)

Brief introduction to NaturaConnect

Designing a resilient and coherent Trans-European Network for Nature and People (TEN-N)

July 2022 – September 2026

NaturaConnect co-develops

knowledge, tools and capacity

to support **countries** realizing the **EU Biodiversity Strategy 2030 objectives:**

- 30% of land and sea protected
- 10% thereof strictly
- Establish TEN-N

Project consortium

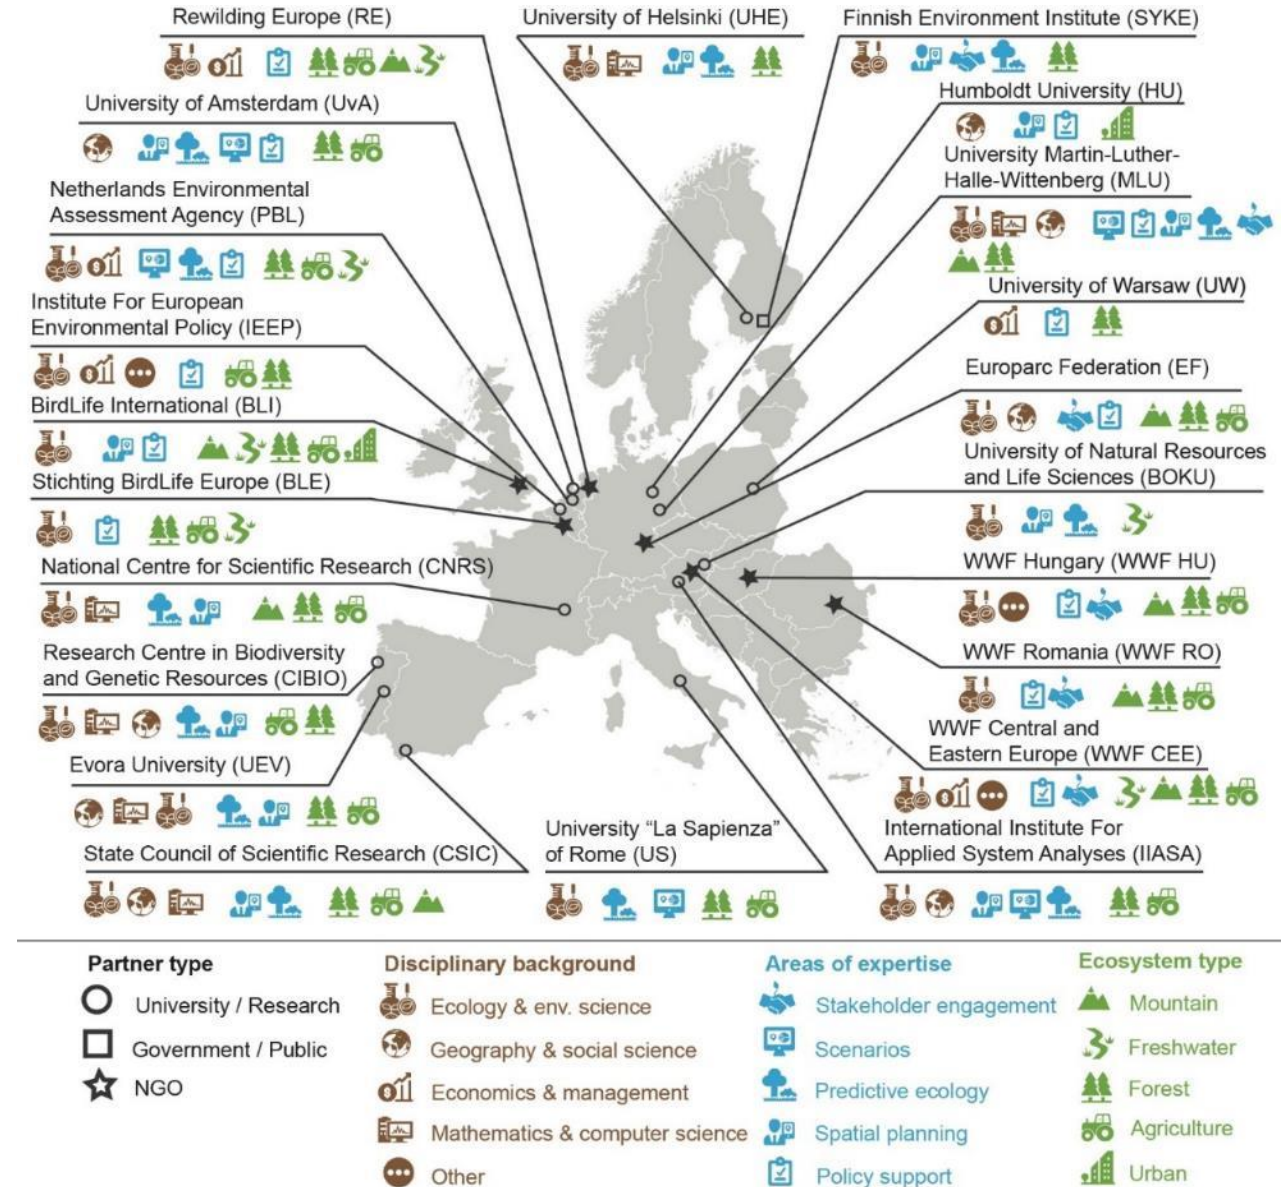

17 Research institutions

5 Policy and practitioner organisations

12 countries across Europe

Lead: International Institute for Applied System Analyses (IIASA), Austria

Co-lead: Martin-Luther-University, Germany

Source: IIASA, 2022

Code 1657 1632

Where are you joining from today?

What is your primary expertise or background?

What is the most prominent threat related to climate change in your region or protected area?

Wildfires

Extreme heat

drought

Drought

Drought and extreme floods.

drought

Drought

Weather extremes, resulting in floods and droughts

What is the most prominent threat related to climate change in your region or protected area?

Diebacks, invasive species distribution

Agricultural Land Abandonment

Flooding and heavy rainfall - more unpredictable

drought, extreme weather, unpredictability

Esrrming winters affecting Nordic ecosystems

weather extremes

Floods , fires, invasive species, heat

Extremes

What is the most prominent threat related to climate change in your region or protected area?

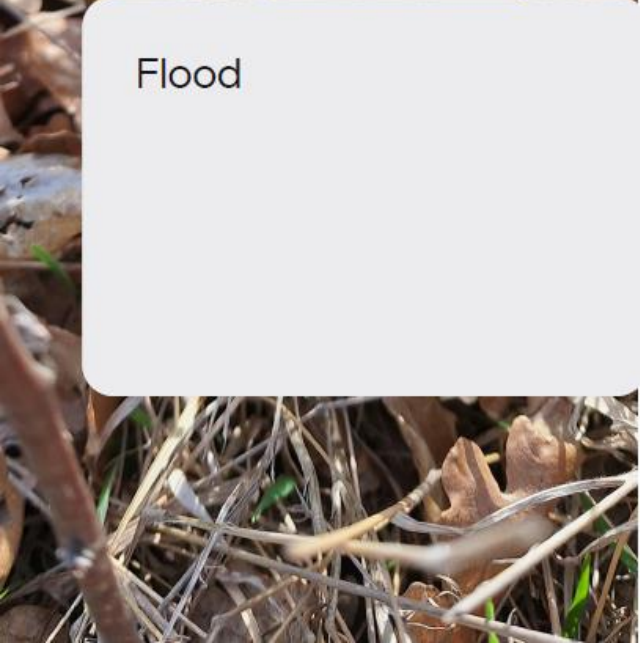

precipitation pattern changes. Drought seasons

Drought, / Floods

Fire.

Massive tourism

Flood

salinization (seawater intrusion)

Less snow and rain on snow events

dieback of some tree species

Introduction to climate-resilient planning & methodology

26/03/2026

Why climate resilient planning

- Average climate velocity in European protected areas is predicted at 1.2-3.3 km/yr
- Average climate magnitude is predicted to be 4.3-6.7 higher than standard deviation of past climate variation

Cimatti et al. (2025) Glob Change Biol, 31: e70261

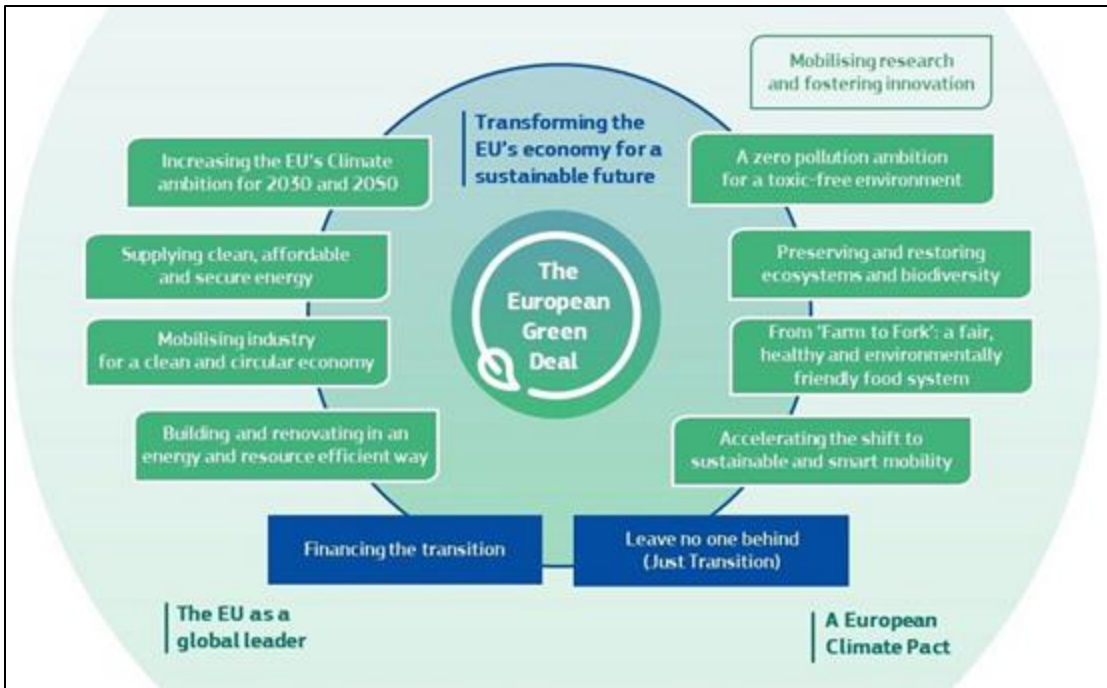

The disappearance of Doñana's Santa Olalla lagoon in August 2022

Climate-proofing European environmental action

European Climate Law

by 2020 - **20%** by 2030 - **55%** by 2050 **net-zero**

(the actual cut was over 30%)

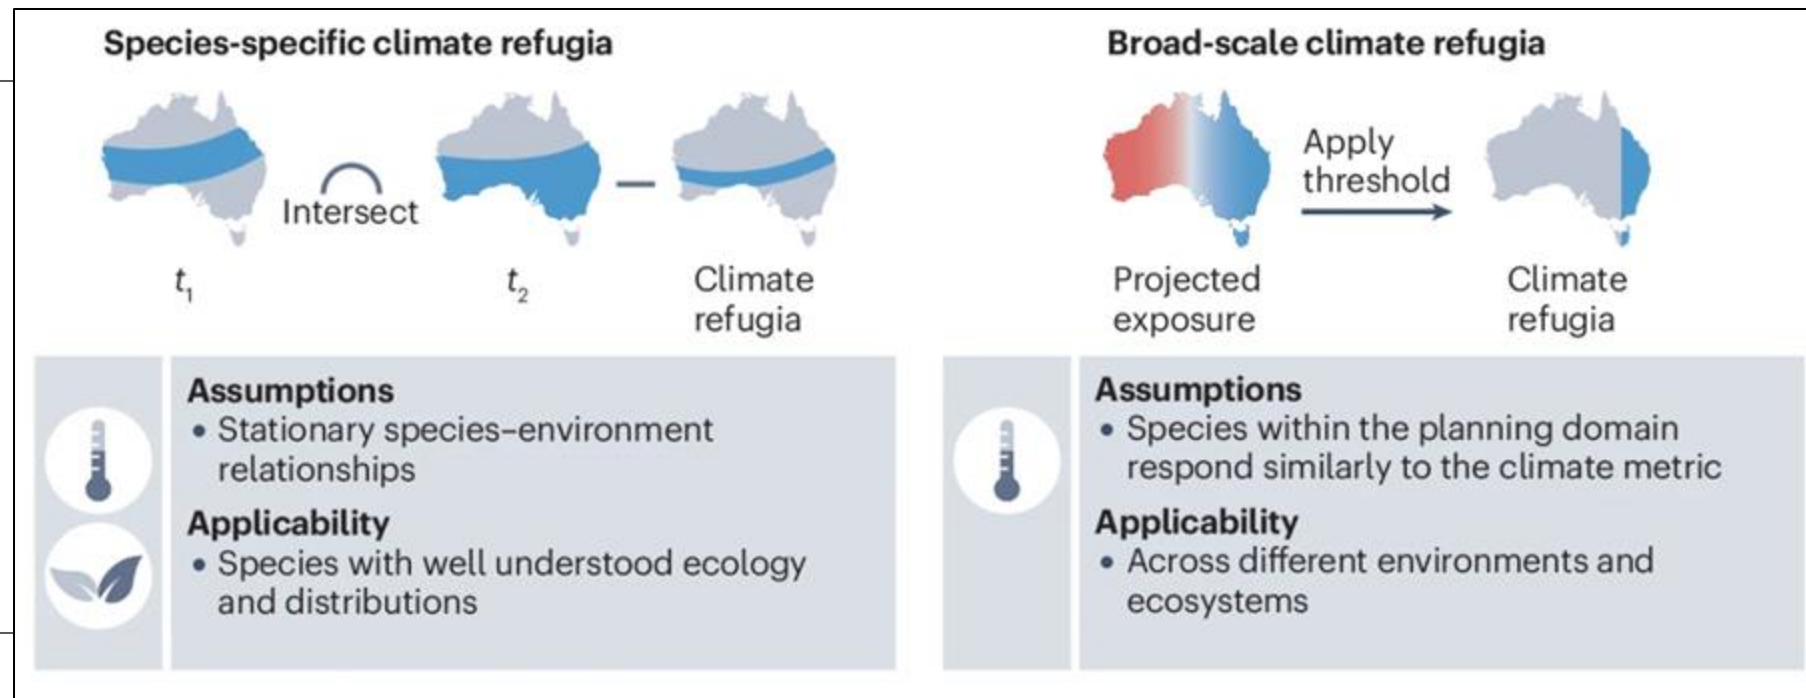

Common approaches for climate-resilient planning

Protect the future habitats of species

Protect areas that facilitate climate connectivity

Protect climate refugia

Protect areas that promote adaptation

Buenafe et al. (2025) *Nat. Rev. Biodivers.* 1, 284–297

Common approaches for climate-resilient planning

Protect the future habitats of species

Protect areas that facilitate climate connectivity

Protect climate refugia

Protect areas that promote adaptation

Climate corridors (using SDMs)

Climate corridors (using climate velocity)

Assumptions

- Species can move across and remain within climate corridors

Applicability

- When identified using SDMs, can be applied for species with well understood ecology, distributions, and dispersal rates

Buenafe et al. (2025) *Nat. Rev. Biodivers.* 1, 284–297

Common approaches for climate-resilient planning

- Protect the future habitats of species
- Protect areas that facilitate climate connectivity
- Protect climate refugia
- Protect areas that promote adaptation**

d Adaptation potential (6% of 118 studies)

Climate representativity

Assumptions

- Species within the planning domain respond similarly to the climate metric

Applicability

- Across different environments and ecosystems
- A surrogate for safeguarding intraspecific variation when genetic information is unavailable

High-climate-risk areas

Assumptions

- Species within the planning domain respond similarly to the climate metric

Applicability

- Across different environments and ecosystems
- A surrogate for species-specific adaptation hotspots when genetic information is unavailable

Adaptation hotspots

Assumptions

- Species within the planning domain respond similarly to the climate metric

Applicability

- Across different environments and ecosystems, provided the climate metric measuring adaptation potential is applicable
- A surrogate for species-specific adaptation hotspots when genetic information is unavailable

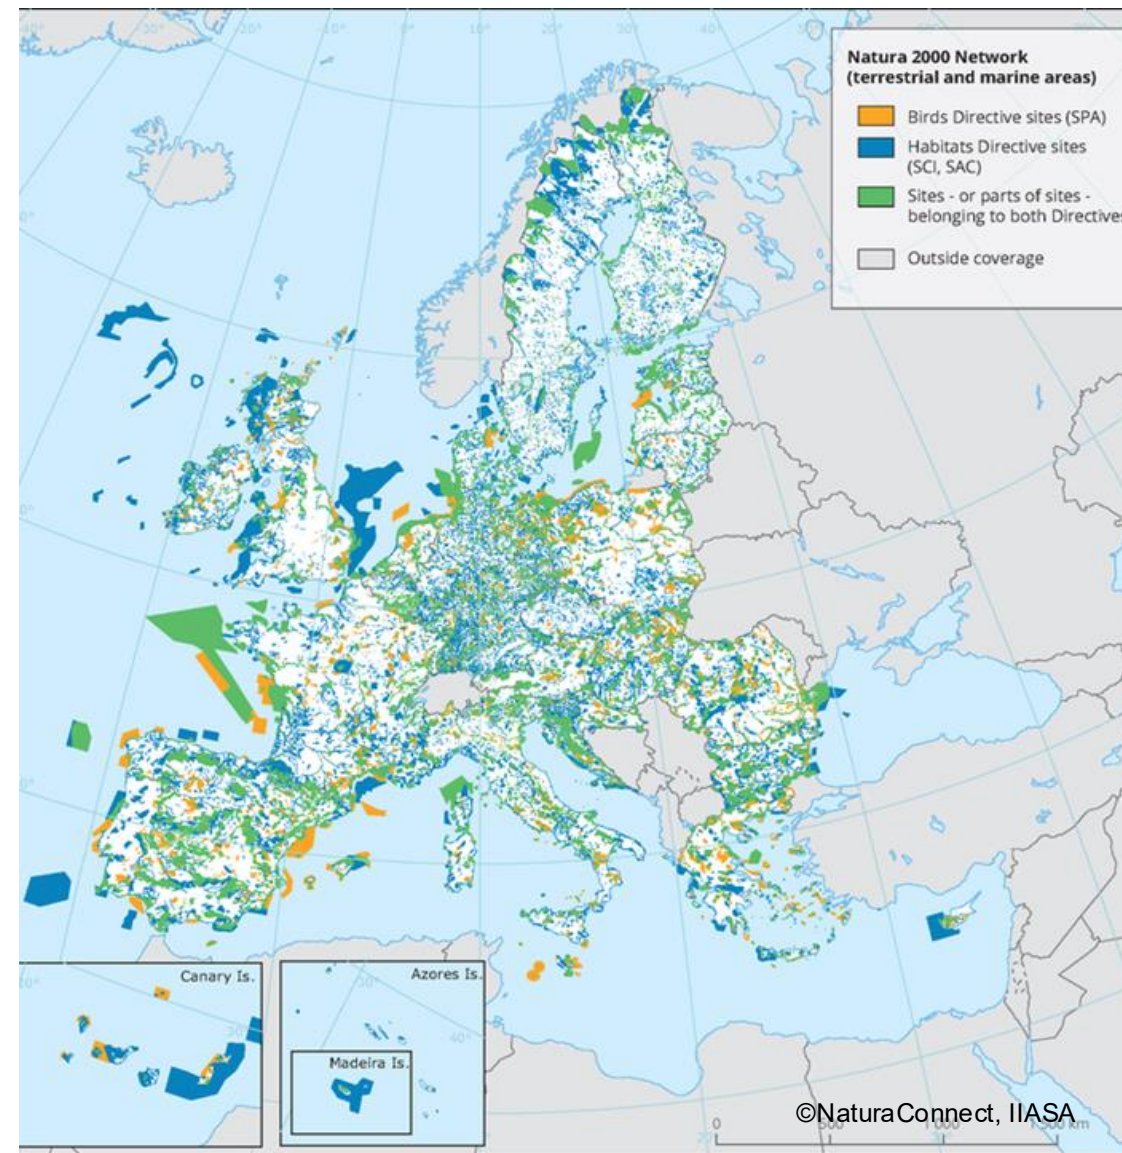

Buenafe et al. (2025)
Nat. Rev. Biodivers. 1, 284–297

Climate-resilient planning in NaturaConnect

NaturaConnect approaches for climate-proofing the Trans-European Nature Network (TEN-N).

- Assess present and future species distribution (using SDMs) and identify climate connectivity nodes
- **Assess climate change exposure** to identify refugia and anticipate risks
- Assess adaptive potential by identifying bioclimatic subcomponents of each species

Cimatti et al. (2025) Glob Change Biol, 31: e70261
Cimatti et al. (2025) bioRxiv, 2025.10.26.684389
Cavalcante et al. (2025) bioRxiv, 2025.10.27.684983

Climate exposure in Europe: today's problem!

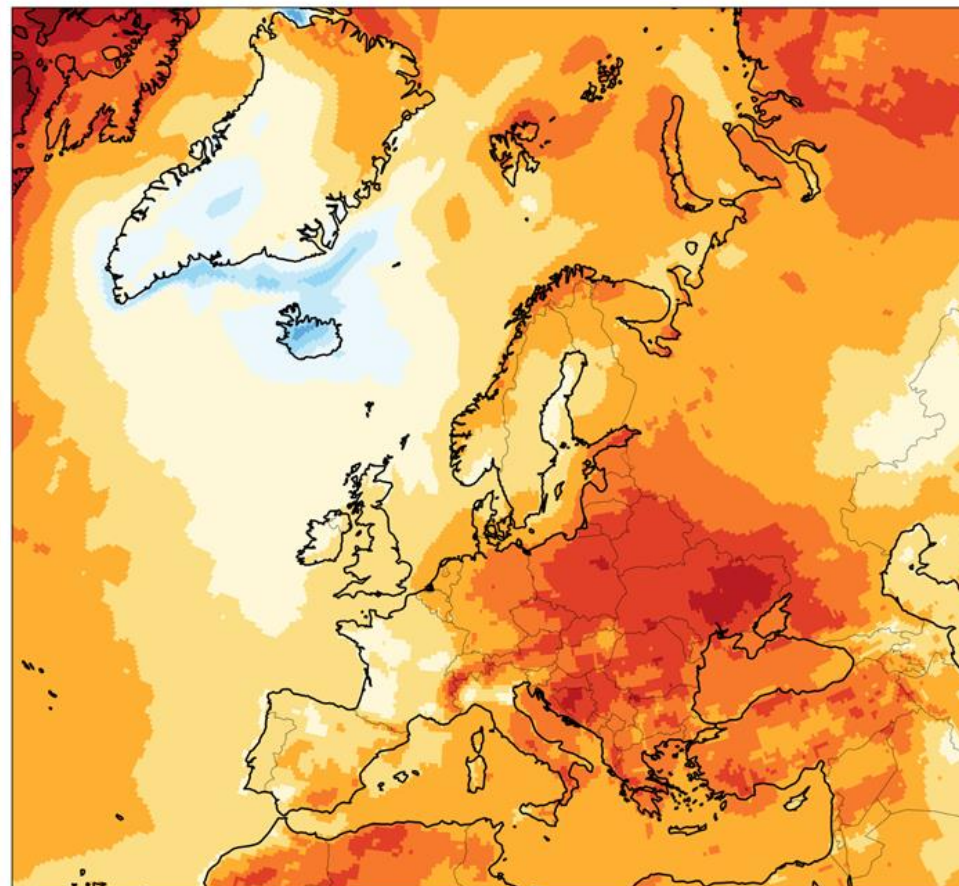

Europe is warming faster than other regions: +2.4 °C in 2024 vs pre-industrial levels (the world is at +1.3°)

Understanding where climate will change the most, and how far are climatic conditions displaced, is key for any conservation action (for any species/habitat)

Climate change adaptation includes a wide range of actions, targeted to individual species, communities, habitat types, whole ecosystems.

Anomalies in surface air temperature in 2024

26/03/2026

Methodology for measuring climate exposure

Climate metrics can assess the overall exposure of biodiversity to climate change

Local climate Velocity

The speed of the shift

Analog climate Velocity

The Distance to safety

Climate Magnitude

the intensity of the novelty

To climate-proof a protected area, we must quantify the speed of change, the distance to the future habitat, and the dissimilarity of the new climate

Climate exposure in Europe and climate metrics

Local Velocity

Spatial gradient (cell-neighborhood method)

$$\frac{\text{Temporal}}{\text{Spatial}} = \frac{\text{Slope } (^{\circ}\text{C year}^{-1})}{\text{Spatial gradient } (^{\circ}\text{C km}^{-1})} = \text{km y}$$

- Focal cell
- 3x3 Neighborhood of cells
- Eight adjacent neighbors

Definition: The speed(km/year) climatic conditions (isopleths) travel across the landscape

The analogy: the treadmill: How fast and in what direction, must an organism move to maintain its current climatic conditions?

Key factor: Topography
Velocity is often higher in flatlands than mountains

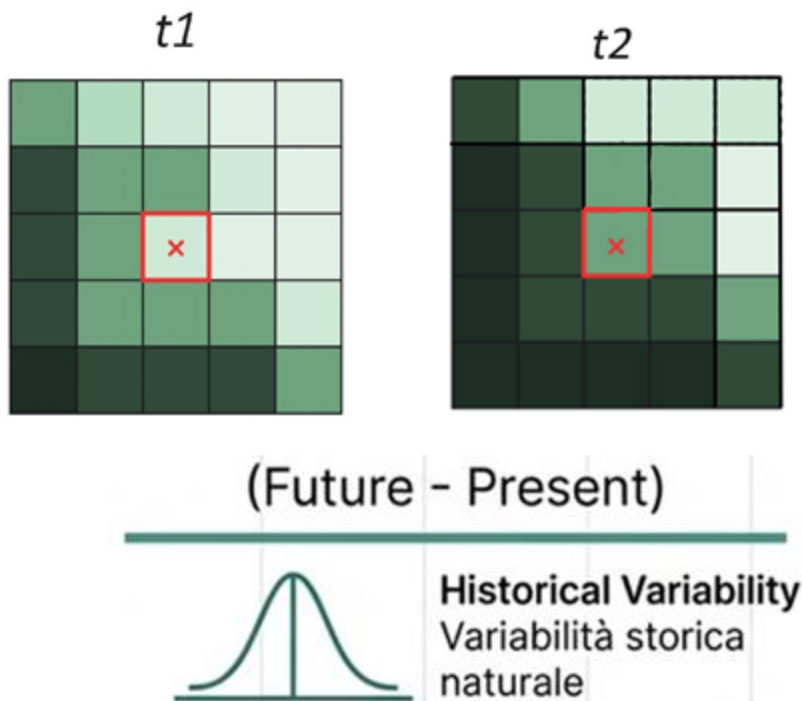

Climate exposure in Europe and climate metrics

Magnitude

$$\text{Magnitude} = \sqrt{\sum_{k=1}^2 \frac{(t2_{ki} - t1_{ki})^2}{s_{ki}^2}}$$

Definition: The degree of difference between the future climate and the historical baseline

Key insight: magnitude is a unitless variable. A value of 2 or 3 means the area will experience climate shifts twice or thrice as extreme as its historical baseline norms, overwhelming the adaptive capacity of many species

Methodology summary

3 climate metrics x 2 bioclimatic variables, Tas and Pr, 1km res

- Local climate velocity
- Analog climate
- Magnitude

Comparison of climate exposure inside and outside PAs (EU28) using propensity-score matching

- **SSP5-8.5**: Fossil-fueled Development ~ 5°C
- **SSP3-7.0**: Regional Rivalry ~ 4°C
- **SSP1-2.6**: Sustainability ~ 2°C

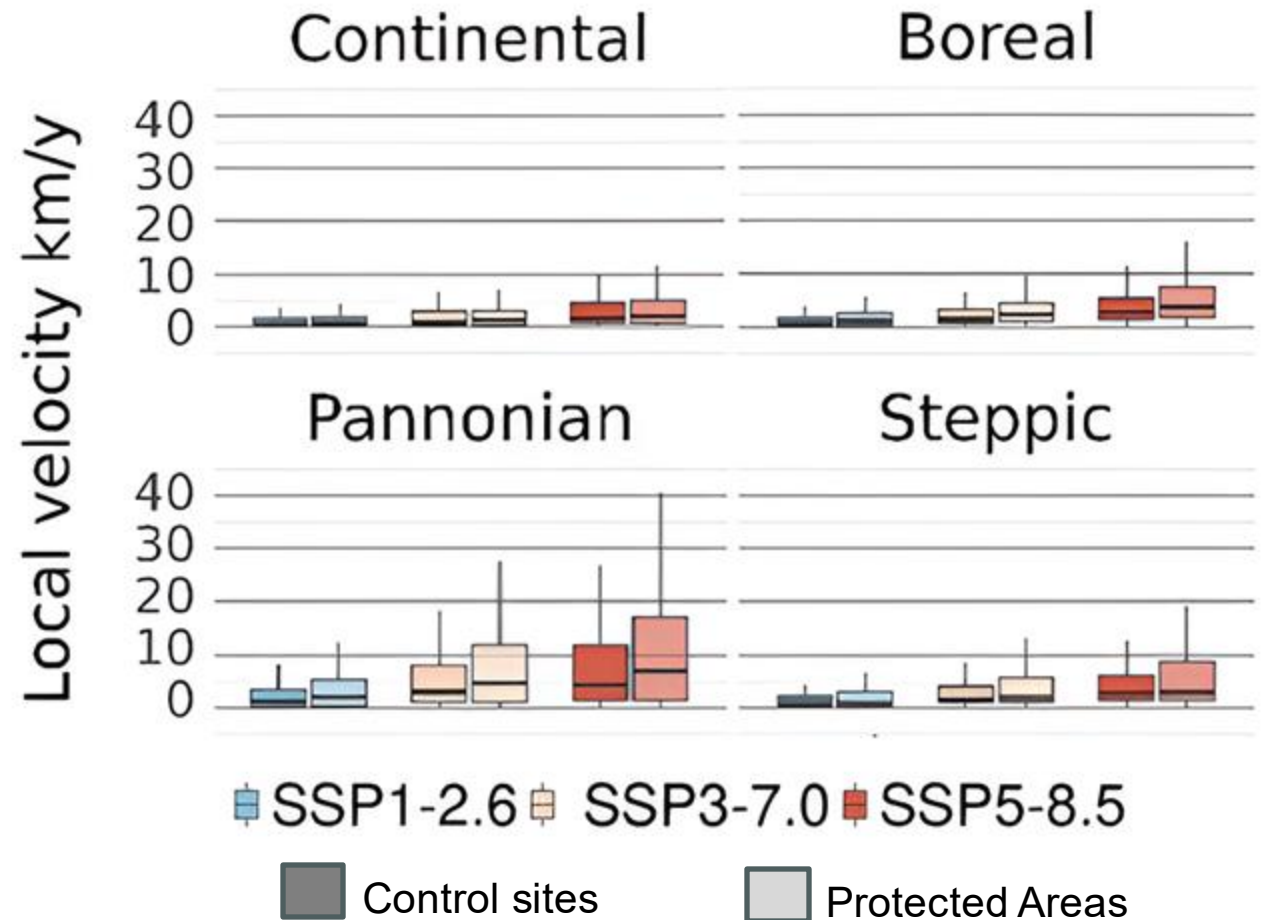

Ensemble model for the “historical“ (1980-2010) and “future“ (2041-2070) time window

Results: Local climate velocity in Europe

Ensemble Local Climate Velocity under SSP7-3.0

Median value of **2.2 km/year** (s.d. = 12.4 km/year)
 1.7 km/year in 1980-2010
 Higher velocity in the north and in flat areas

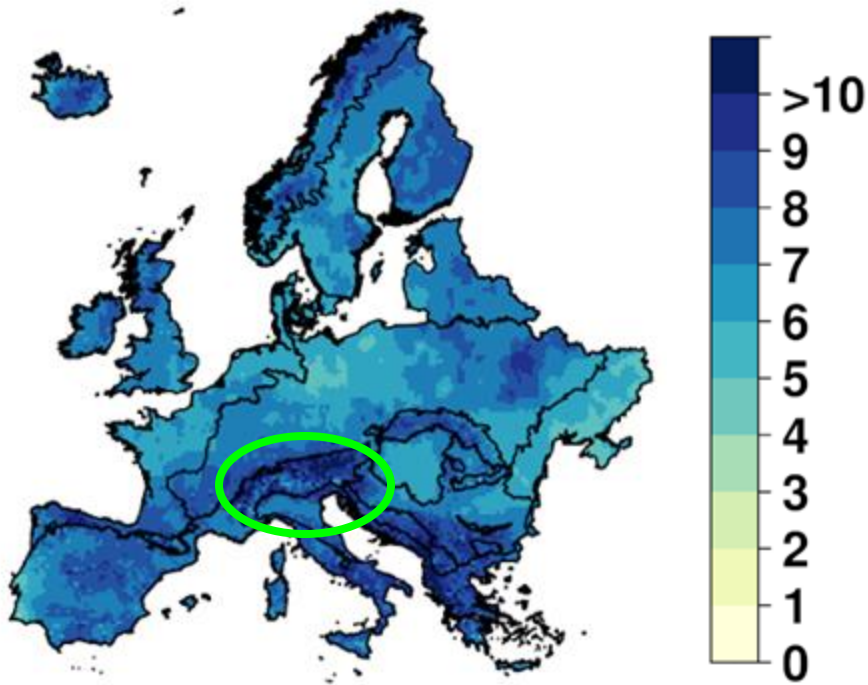

Wilcoxon test: p-value <0.001: ***

Cimatti et al. (2025) *Glob Change Biol*, 31: e70261

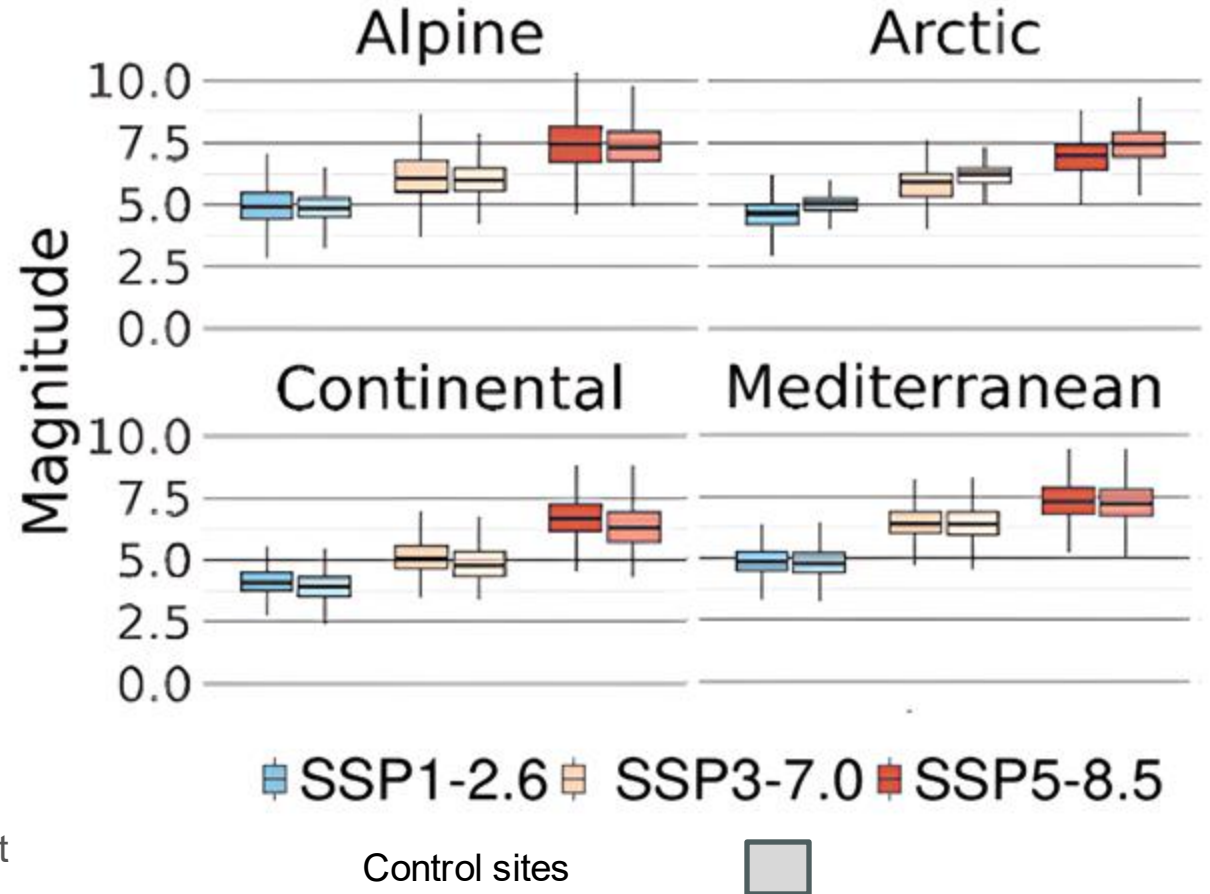

Results: climate Magnitude in Europe

Ensemble Climate Magnitude under SSP3-7.0

Median magnitude value of 4.8 (s.d. = 1.01) under SSP3-7.0
3.9 under SSP1-2.6

Higher values in mountainous areas and in the south and northeast

■ SSP1-2.6 ■ SSP3-7.0 ■ SSP5-8.5

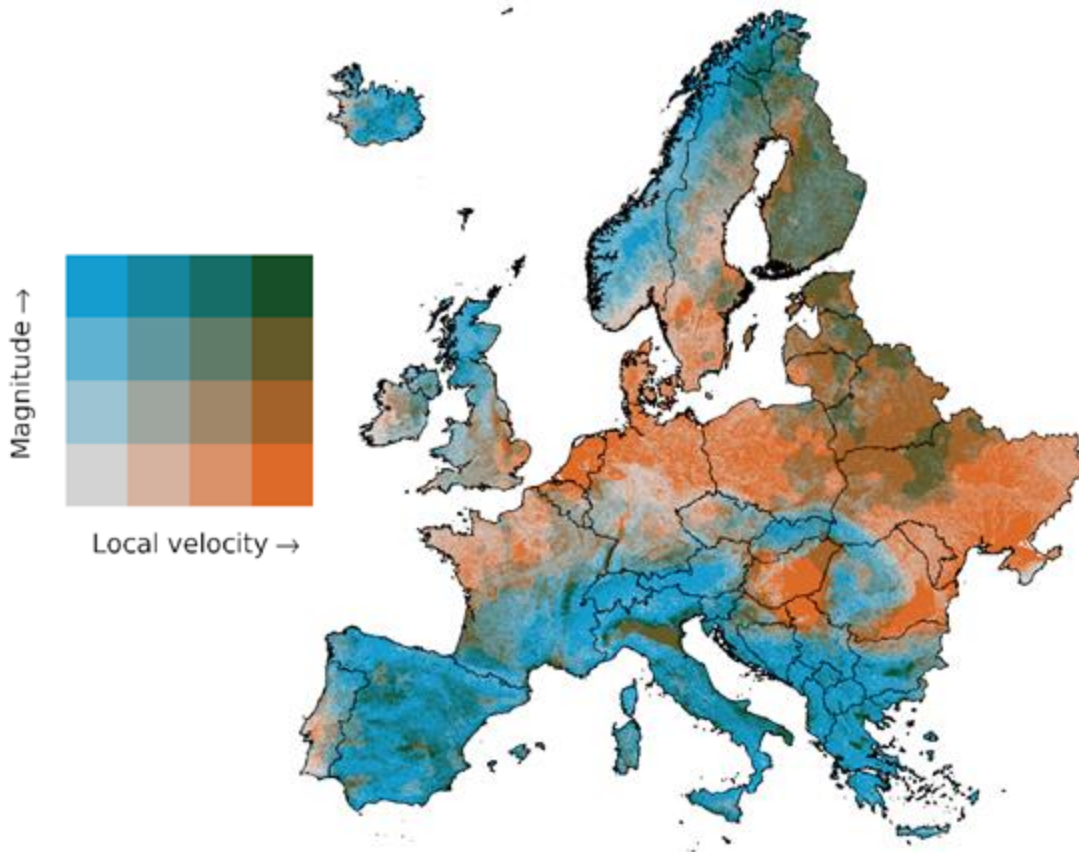

Control sites

Wilcoxon test: p-value <0.001: ***

Climate exposure in Europe

Climate hotspots/coldspots in Europe under SSP3-7.0

- **Increasing risk** $SSP1-2.6 < SSP3-7.0 < SSP5-8.5$
- **Higher or similar exposure for PAs and control sites**
- Hotspots of risk & refugia
- 61% (67% three metrics) of protected areas (PAs) overlap with hotspots (1.2% joint hotspot)
- Only 2.4% of PAs are in joint coldspots (1% three metrics)
- --> risk for PA conservation role and **false sense of protection!**

Key adaptation measures for biodiversity conservation

- Account for **climate exposure** during **conservation planning**
- Without adaptive planning, species may be driven out of existing PAs, reducing their effectiveness
- Identify areas and species facing particular risk and **evaluate specific intervention**

- Protect **climate refugia**
- Enhance **landscape connectivity** to facilitate species dispersal
- Preserve **genetic and ecological diversity** to maintain adaptive potential
- Habitat restoration, creation of microhabitat, translocation

The NaturaConnect Learning Platform – Practical application

NaturaConnect Learning Platform

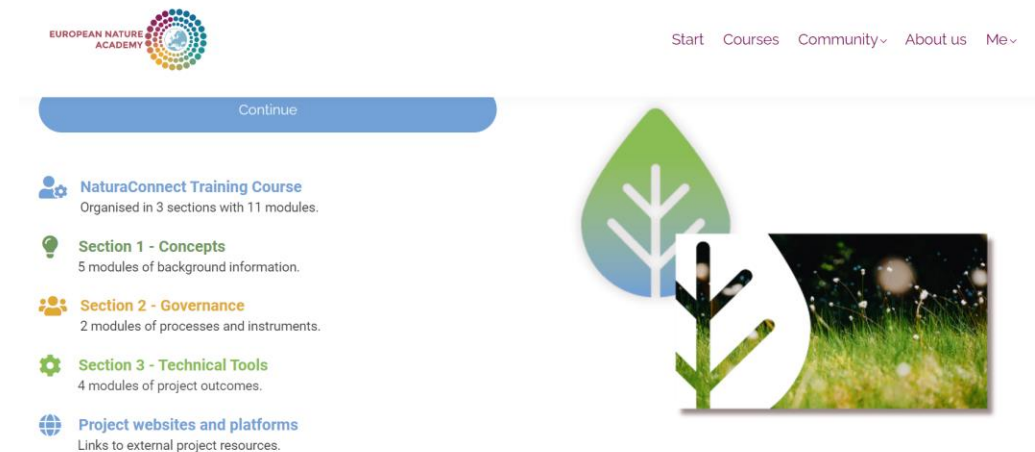

Target audience

Biodiversity conservation managers, spatial planning technicians and data analysts

Objectives

- Improve conservation planning
- Empower users to apply NaturaConnect outputs

Free self-paced course with sequential and stand-alone modules, hosted by the [European Nature Academy](https://www.european-nature-academy.org/)

Landing page of the NaturaConnect Learning Platform

<https://tinyurl.com/ENA-NC>

Section 1 - Concepts

Background information.

Modules

- 1.1. Trans-European Nature Network (TEN-N)
- 1.2. Cross-sectoral Policy Frameworks
- 1.3. Nature Futures Framework (NFF)
- 1.4. Connectivity Conservation
- 1.5. Integrated Spatial Planning

Section 2 - Governance

Processes and instruments.

Modules

- 2.1. Stakeholder Engagement
- 2.2. Financial Instruments

Section 3 - Technical Tools

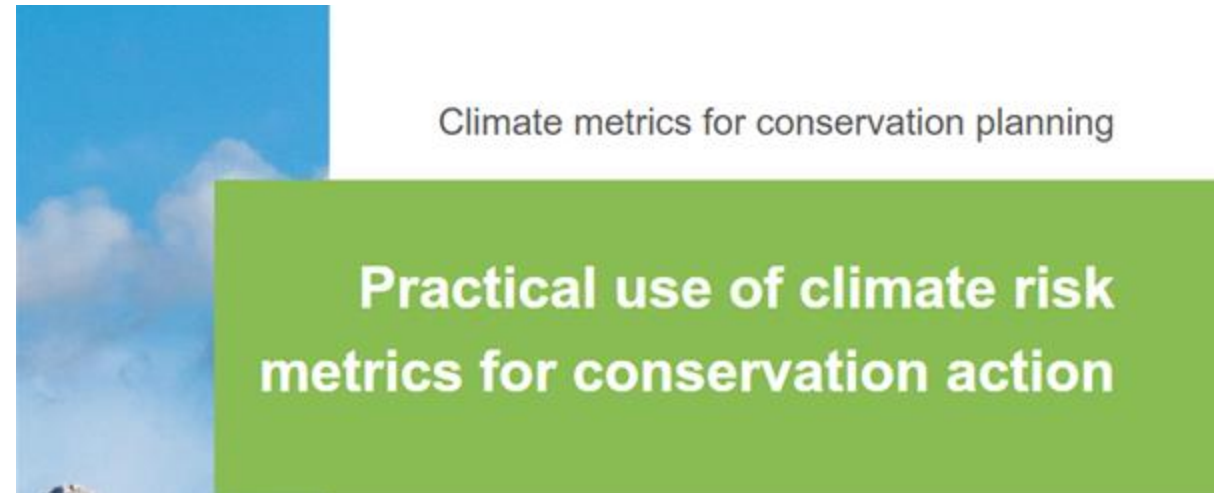

Project outcomes.

Modules

- 3.1. Biodiversity Modelling
- 3.2. Scenarios on Land Use and Climate Change
- 3.3. Connectivity Analyses
- 3.4. Spatial Planning for Protected and Restoration Areas

Learning modules

Practical application across different scales

Graphic: NaturaConnect Learning Platform – module on climate metrics for conservation planning

Different conditions, different actions, different scales:

- Restoration practitioner
- Protected area managers
- Regional and national authorities

How to define thresholds?

Velocity: species or group-specific dispersal ability, 0.5 km/y for amphibians and reptiles, 3 km/y for mammals and birds (Warren et al., 2018)

Magnitude: statistically based, 5.33 (Williams et al., 2007). When exceeded, it indicates a “novel climate”

High velocity and Low magnitude

Modest changes in climatic conditions compared to baseline variability in the focal cell but not in the surrounding.

Restoration projects: increase connectivity between patches, create corridors and facilitate species movement.

Protected area management: increase collaboration across nearby protected areas with similar habitats.

Regional and national authorities: inform land use decision highlighting the need for corridors and stepping stones habitats, avoid barriers to movement.

Low velocity and High magnitude

Slow movement of climate conditions across space, but with intense local changes compared to the baseline variability

Restoration projects: site-specific actions to adapt to extreme local shifts. Carefully evaluate species climatic niche during planning

Protected area management: Create microrefugia, for example shady patches or water features like artificial ponds

Regional and national authorities: embed microrefugia into planning of protected areas, with specific funding for this kind of adaptation

High velocity and High magnitude

Climatic conditions change rapidly and with high local intensity.

Restoration projects: future-proof restoration by looking at future climate rather than to historical conditions

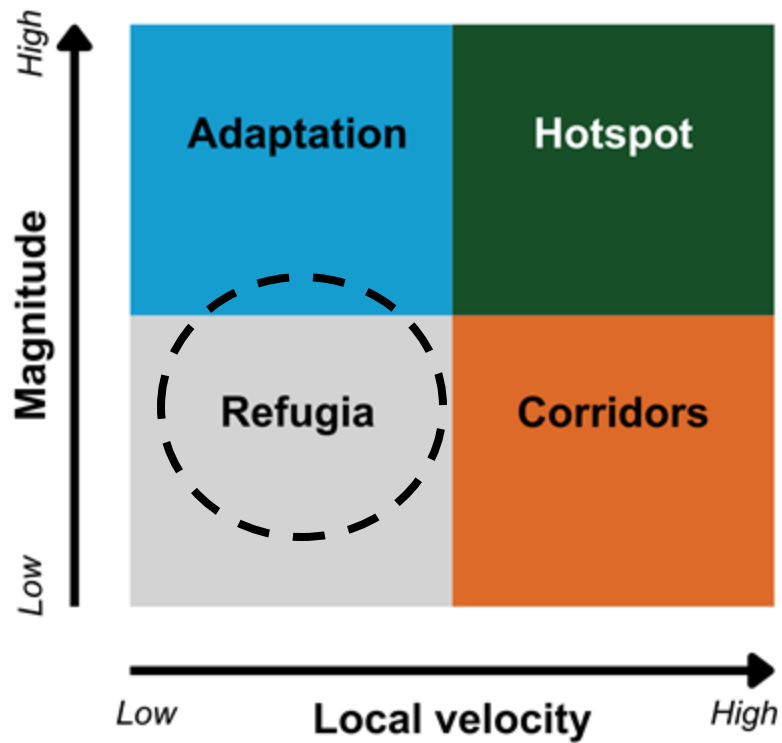

Protected area management: Multifaceted approach, assisted migration, monitoring, experimental adaptive management

Regional and national authorities: assess each conservation project to ensure climatic compatibility. Prioritize area based on climatic trade offs

Low velocity and Low magnitude

These areas offer favourable conditions for long-term species persistence

Restoration projects: degraded climatic refugia are crucial area for conserving species, especially if close to nearby biodiversity rich areas

Protected area management: enhance connectivity to climatic refugia. monitor and asses these area to benchmark the impact of climate change on other areas.

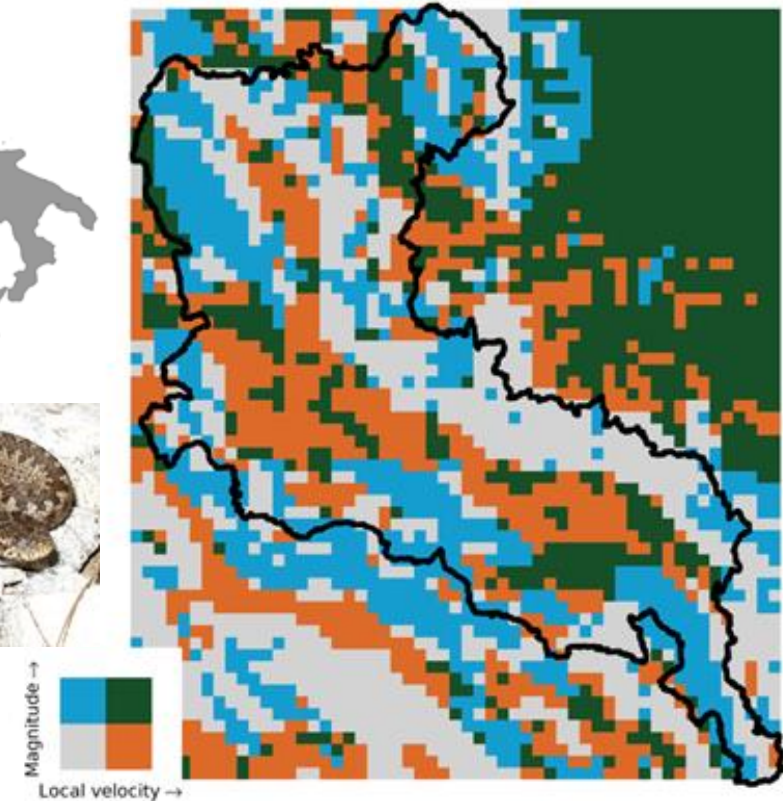

Regional and national authorities: refugia are conservation strongholds, avoid disruptive land use. Ensure protection and/or connectivity to these areas.

Practical example: Gran Sasso National Park

- This central Apennine protected area is rich in endemic Italian species.
- Climate analysis shows the south-eastern portion, particularly north-facing slopes, is less exposed to climate change.
- Conversely, south-facing slopes show higher exposure (velocity and magnitude).
- Mountain peaks are the most exposed, with no analogue climate within hundreds of kilometres (1 km/y equals a 60 km shift; 7 km/y equals 420 km).
- These high-altitude zones face major climate shifts, limiting species' migration options and posing a high risk to biodiversity, such as the threatened high-elevation snake *Vipera ursinii*, whose habitat could shrink significantly in 30 years.

Parco nazionale del Gran Sasso e Monti della Laga
Local Velocity and Magnitude under SSP3-7.0

How to elaborate climate metrics by yourself?

```
# Combine rasters into a stack
climate <- raster::stack(hist_temp, hist_prec, hist_temp_SD, hist_prec_SD, ssp126_temp,
ssp126_prec)

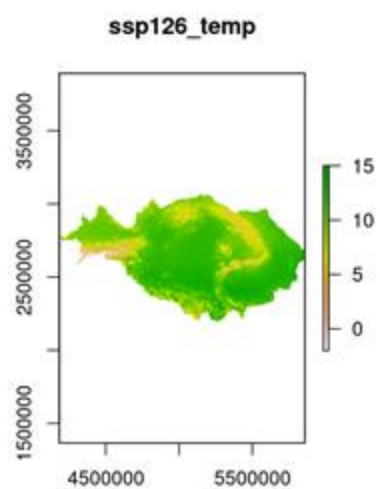

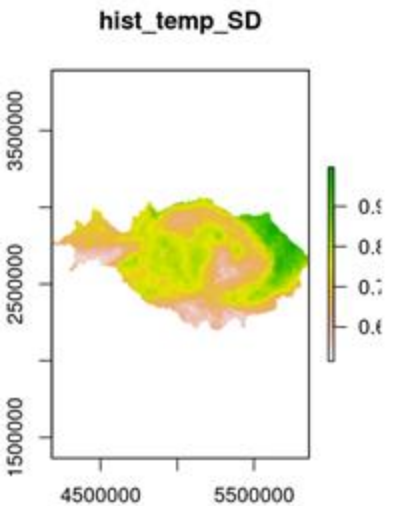

#rename them
names_climate <- c("hist_temp", "hist_prec", "hist_temp_SD",
"hist_prec_SD", "ssp126_temp", "ssp126_prec")
names(climate) <- names_climate
```

Topic 3.2.b

Tutorial - Calculating climate change exposure using multiple metrics: a practical introduction

Analogue (distance-based) climate velocity.

$dVoCC = \text{distance to climate analogue} / \text{time between analogous climates}$

```
#crop the stack
climate <- raster::crop(climate, dan_car)

#mask and plot
climate <- mask(climate, dan_car)

par(mfrow = c(1, 2))

plot(climate[[2]], main = names(climate)[[2]], zlim = range(0, 2500))
plot(climate[[1]], main = names(climate)[[1]], zlim = range(-2, 15))
```

Learning Platform tutorial

Define the threshold used to identify each climate analogue using **1.5 standard deviation** from the historical mean for both temperature and precipitation.

Key step: identification of a **biologically meaningful maximum distance** within to look for a climate analogue, due to computational time.

#now we can use the dVoCC function, please note that this step may take some time to complete and requires some Gb of RAM:

```
dvocc_dan_car= dVoCC(clim = climate_df,  
  n = 2, # number of climate variables,here temperature and precipitation  
  tdiff = 60, # number of years between time periods  
  method = "Variable", # specify that all cells will have different threshold  
  distfun = "Euclidean", # specify function to calculate distances to analogues  
  lonlat = FALSE, # not projected coordinates  
  geoTol = 100000, #set max distance to analogue (in map units, in this case meters),  
  here to 100 km  
  climTol =NA #since method is variable this has to be NA  
)
```

Analogue velocity under SSP1-2.6

You are now ready to evaluate the climatic exposure of any area of your interest!

Data and resources

The screenshot shows a Zenodo record page. At the top, there is a search bar and navigation links for 'Communities' and 'My dashboard'. The record title is 'The accelerating exposure of European protected areas to climate change', published in 2025, version v2. It has 576 views and 120 downloads. The authors listed are Cimatti, Marta and Di Marco, Moreno. The contact person is Mezzanotte, Valerio. There are buttons for 'Default' and 'Open'.

Adaptation of forests is a priority strategy:

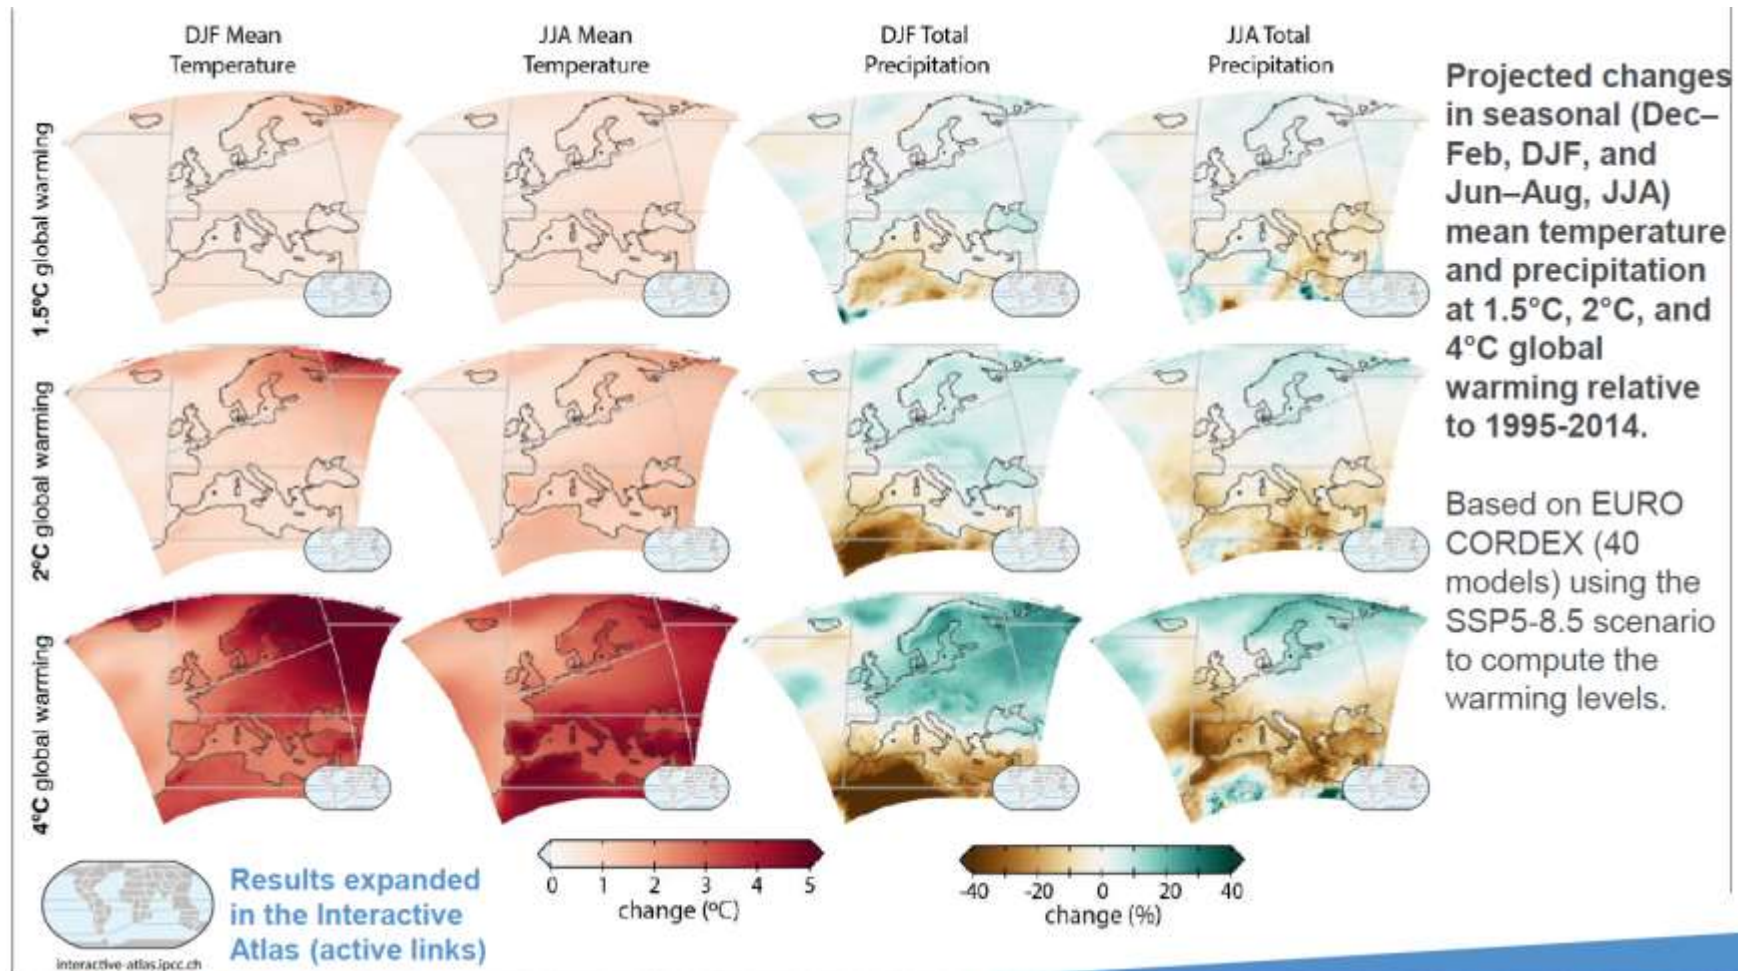

- Large area
- With high conservation values
- Highly vulnerable to climate change
- In a context of rural depopulation and abandonment

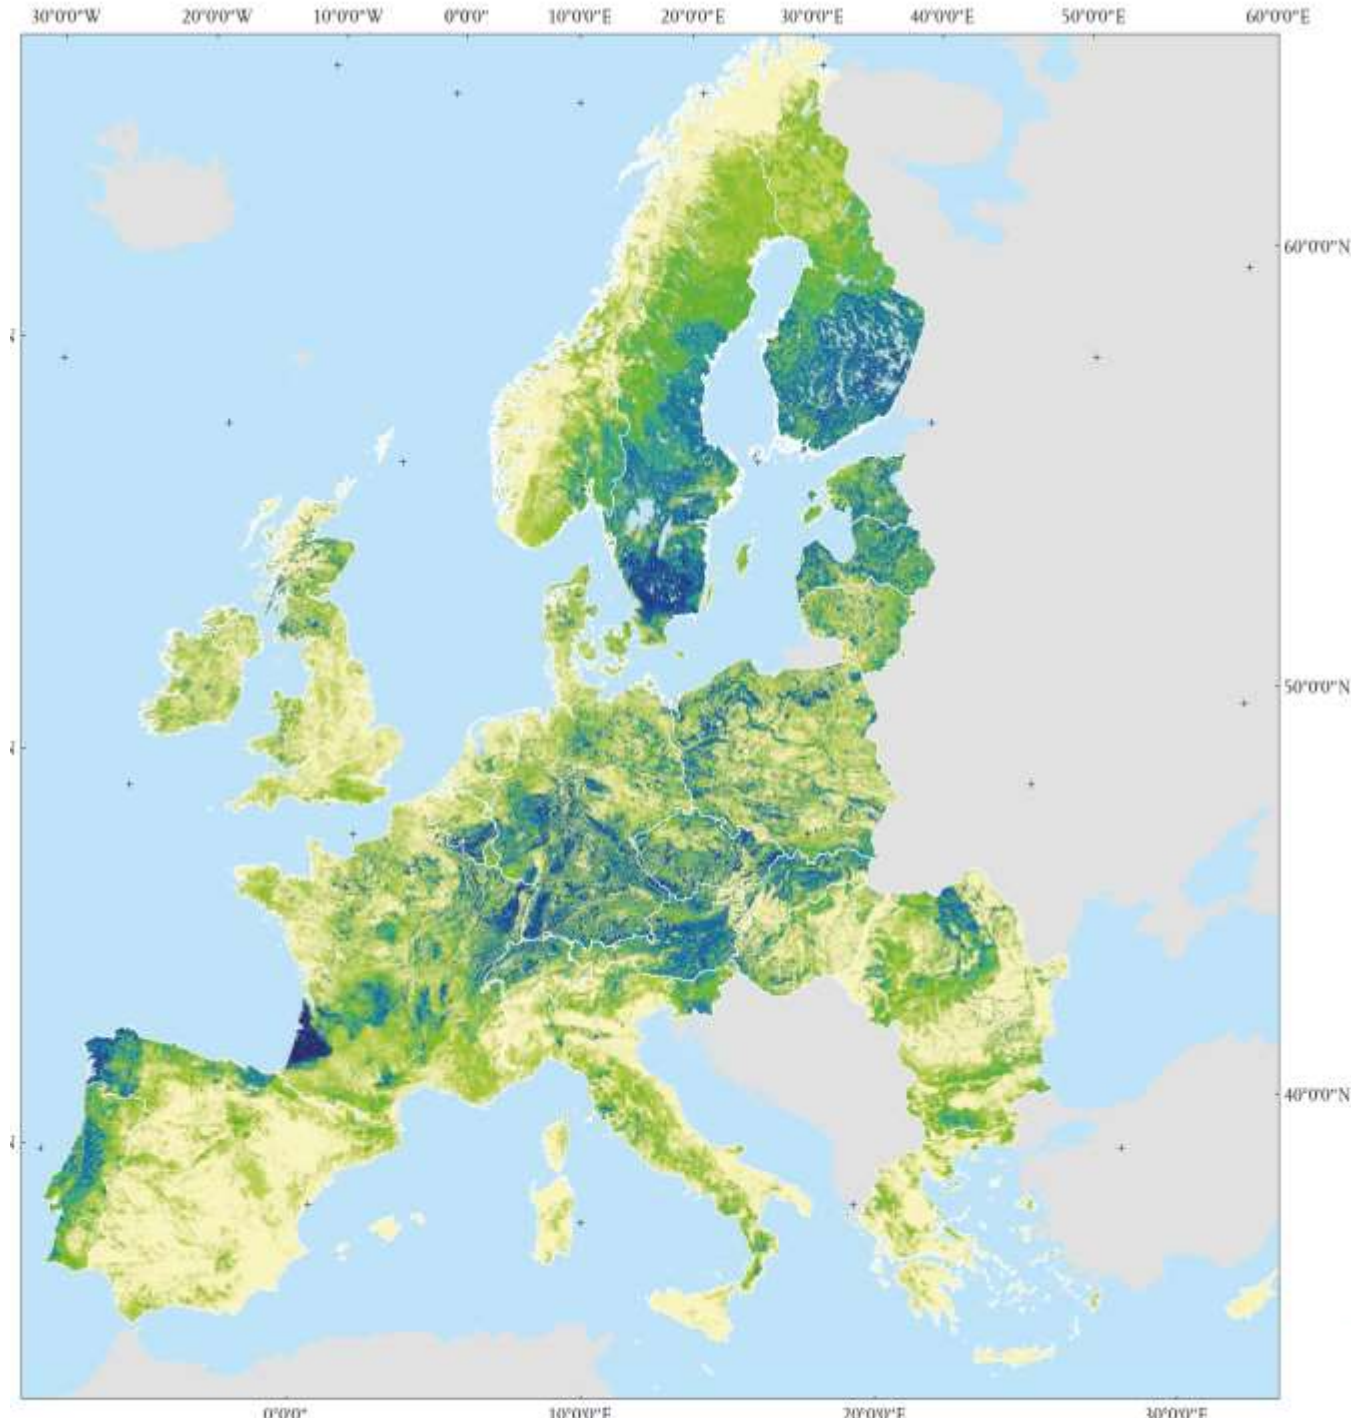

Forest Habitats of Community Interest represent 50% of the Natura 2000 area in the EU.

**In Spain: Natura 2000 = 27%
80.000 km² forest in Natura 2000**

Climate change will be (is) specially intense in the Mediterranean basin

Temperature increase. More frequent heat waves
More intense and frequent droughts

Wood production (m³ -ha⁻¹-year) in Europe averaged over the period 2000-2010.

EUROPEAN FOREST INSTITUTE

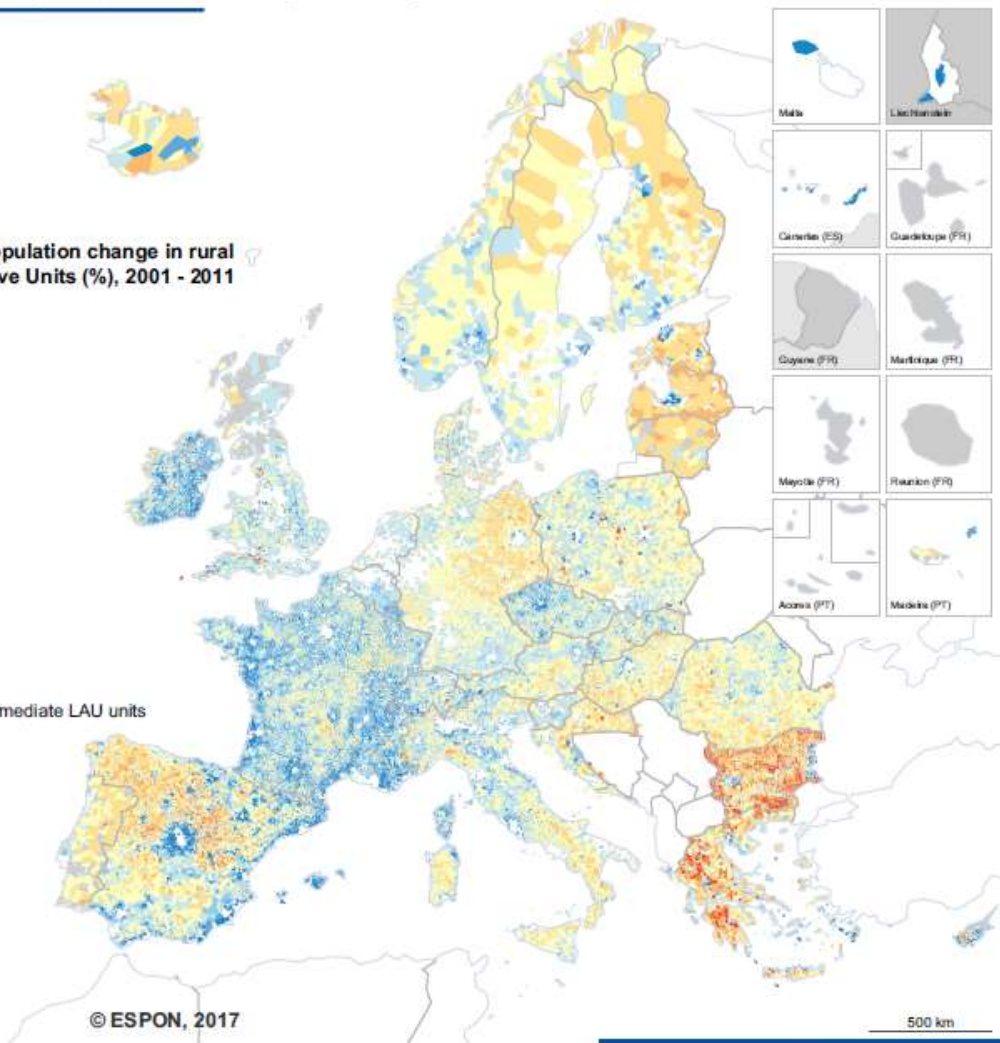

Population change in predominantly rural regions, 2001-2011

Average annual population change in rural Local Administrative Units (%), 2001 - 2011

urban or intermediate LAU units
 no data

Notes
 - Data for LT, PT, SI correspond to LAU1

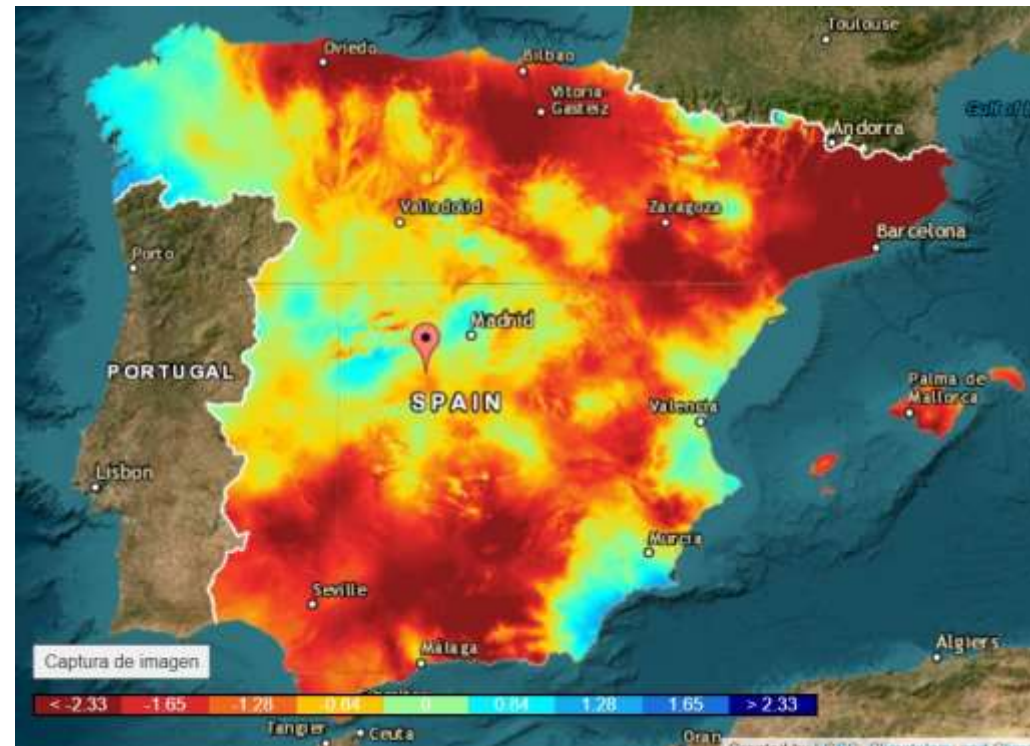

Climatic hazards: drought

Increase in frequency of heat waves and long lasting droughts

Drought index, 2023 (SPEI 24 month)

Monitor de sequía, Vicente-Serrano et al. 2017

What makes forests more resilient to drought?

•Forests with heterogeneous structure & uneven aged/multi sized are less vulnerable

- Structural diversity/heterogeneity as an adaptation pathway.
- Complexity translates into greater resistance to different types and intensities of disturbances.

Mixed and diverse forests are less vulnerable

- Tree species diversity
- Functional trait diversity (embolism resistance, resprouting capacity, rooting depth).

Mature forests are more resilient to disturbances

1. Thick and old trees that host microhabitats
2. Clearings in the canopy where regeneration begins
3. Large dead wood, either standing or on the ground
4. Trees of various species and ages with different sizes

An index for assessing drought risk

Climatic exposure

- Frequency & intensity of drought
- Suitability of species to local climate

Geographic exposure

- Topographic moisture
- Solar radiation
- Soil development

Susceptibility

- **Functional**
 - Susceptibility to embolism
 - Root depth
- **Structural**
 - Basal area
 - Diversity of age classes
 - Mean diameter
 - Tree species diversity

Adaptative capacity

- Resprouting ability
- Regeneration

An index for assessing drought risk

Scope	Sub-scope	Criterion	Indicator
Exposure	Climatic exposure		Climatic aridity index
			Climatic suitability of species
	Geographic exposure		Topographic moisture index
			Solar radiation
Vulnerability	Susceptibility	Functional susceptibility	Mean embolism susceptibility
			Mean root depth
			Embolism susceptibility diversity
			Root depth diversity
	Structural and compositional susceptibility	Basal area	
		Mean diameter at breast height (DBH)	
		Number of tree species	
		Number of diameter classes	
	Lack of recovery capacity		Mean resprouting capacity
			Resprouting capacity diversity
		Regeneration index	

Applying the index to improve climate change adaptation of *Pinus pinaster* plantations

Risk variables in the face of drought		BAR	IFN3
Risk		7,3	6,2
Exposure		5,7	5,1
iClimate exposure		5,3	3,9
Climate aridity index		3,9	4,3
Climate suitability of species		6,7	3,5
Geographic exposure		5,8	5,6
Topographic wetness index		7	7,1
Solar radiation		7,4	7,4
Rockiness		2,5	1,9
Vulnerability		8	6,6
Susceptibility		8,1	6,6
Average functional susceptibility	Average susceptibility to embolism	6,4	8
	Average depth of roots	6,9	3,3
Functional susceptibility diversity	Diversity of susceptibility to embolism	9,3	9,7
	Root depth diversity	8	9
Composition and structural susceptibility	Basimetric area	7,3	3
	Normal mean diameter	9,6	6,8
	Number of tree species	5,9	9,4
Lack of capacity to recover	Number of tree species	9,4	8
	Average resprouting capacity	6,7	7,3
	Diversity of resprouting capacity	9,9	8,7
	Regeneration index	8,8	9,1
		4,7	6,3

Mean and standard error of the main dasometric variables

Variable	Control	Before treatment	After treatment	Difference (%)
No. of plots	3	3	3	
Basal area (m ² /ha)	34.6 ± 6.7	34.3 ± 4.9	11.9 ± 2.7	-22.5 (-65.4%)
Density (trees/ha)	820.5 ± 162.8	838.2 ± 76.5	254.6 ± 48.6	-583.6 (-69.6%)
Volume with bark (m ³ /ha)	132.5 ± 43.8	154.3 ± 40.4	54.5 ± 11.6	-99.8 (-64.7%)
Mean height (m)	7.8 ± 1.7	9.4 ± 1.1	9.9 ± 0.9	0.5 (5.9%)
Mean DBH (cm)	23.2 ± 1.1	22.7 ± 0.8	24.2 ± 1.4	1.5 (6.6%)

Some concluding remarks...

Mechanized forestry is the only option with economic return

Not applicable in all cases (vulnerable habitats, inaccessible places...)

Effect will be noticeable on the long term

EBS have moderate effect on vulnerability. May not be effective under drastic climate change

Most forest area is ...

- Young
- Very dense
- Homogeneous, continuous
- Regular structure (few age classes)
- One-species canopy

...should be

- Young and old patches
- Not very dense
- Heterogenous, with open areas
- Irregular (many age classes)
- Several species in the canopy

-  Red deer remains
-  Wild boar remains
-  Ants
-  Maggots
-  Roe deer
-  Snails*
-  Small rodents*
-  Beetles
-  Amphibians*

*Based on dietary research on the Dinaric-Pindos and the Carpathian populations

Common challenge

Impact of climate change on large carnivores

Summer temperatures:
+2°C to +5°C expected increase by 2085.

Winter temperatures: +2°C to +5°C expected increase.

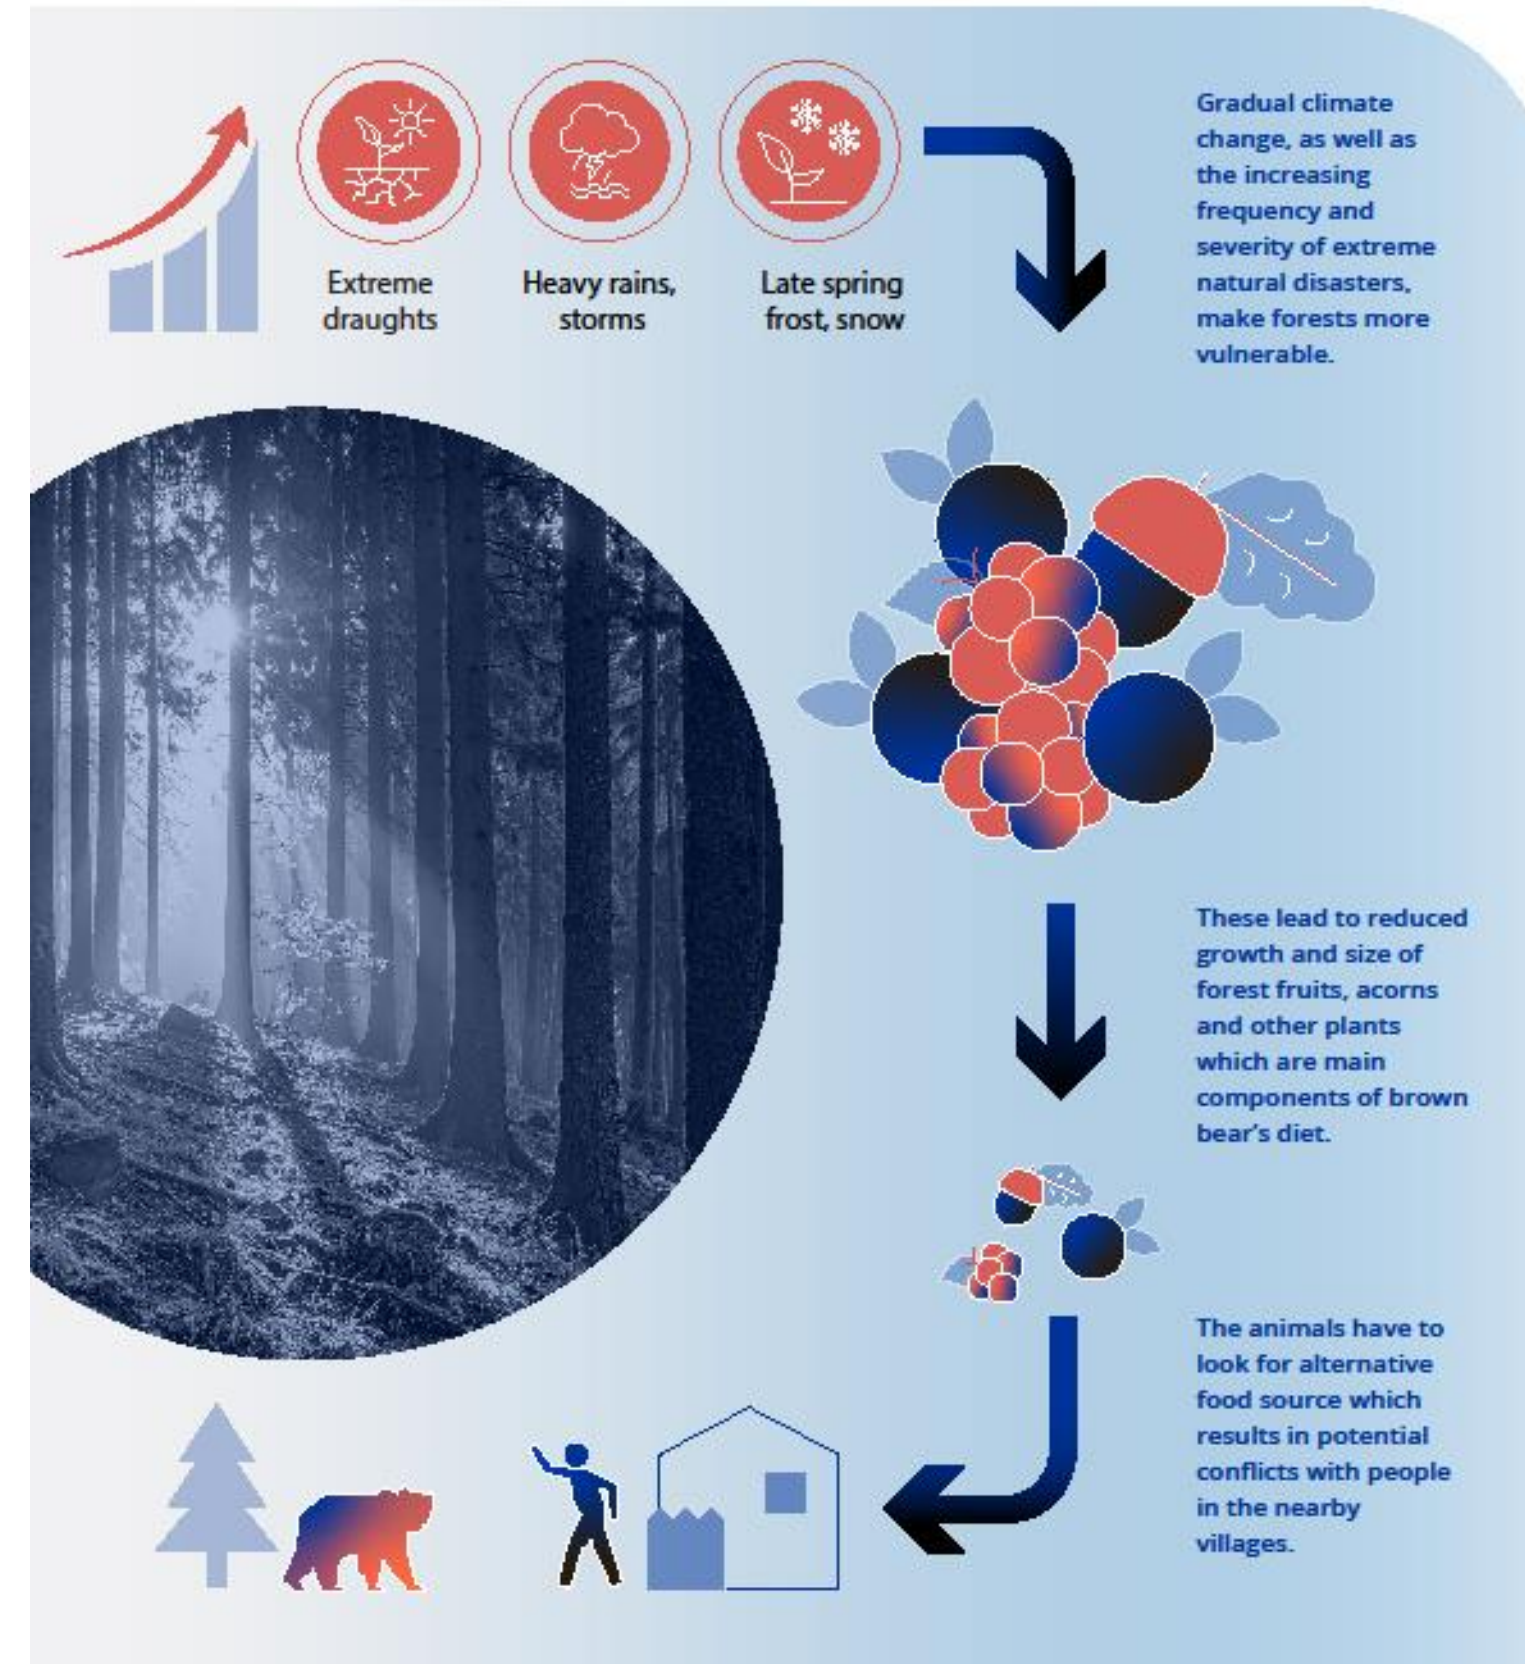

Summer precipitation:
Droughts in Southern Europe.

Storms and wildfires:
Expected to increase in frequency and intensity.

Climate Change Impact On Large Carnivores

How climate abnormalities result in human-wildlife conflicts

Pilot field actions for habitat adaptation

27,7 ha planted with 10 different fruit-bearing species on 21 sites in 6 countries

63,5 ha of improved mosaic conditions through mowing, removal of shrubs and other activities on 23 sites in 6 countries

Pilot area and Intervention sites

Cross-border cooperation in 23 Intervention sites in 9 pilot areas – transnational ecocorridors with low anthropogenic disturbance

- Zapadna Stara planina (BG)
- Stara planina NP (SR)
- Carpathian Biosphere Reserve (UA)
- Apuseni NP (RO)
- Strambu Baiut (RO)
- Slovenski Raj NP (SK)
- Biogradska gora NP (MN)
- Durmitor NP (MN)
- Prokletije NP (MN)

Adaptation Measures

Planting of forest fruit tree species

Only native and site-specific species.

Species selected according to their climate suitability!

Sorbus aucuparia (rowan, European mountain ash)

Sorbus torminalis (Wild service tree) and *Sorbus domestica* (Service tree)

Malus sylvestris (European crab apple)

Pyrus communis (Wild pear)

Prunus avium (Wild cherry)

Prunus mahaleb (Mahaleb Cherry)

Prunus cerasifera (Cherry plum)

Prunus spinosa (Blackthorn)

Crataegus monogyna (Common hawthorn) and *Crataegus pentagyna* (Black hawthorn)

Rosa canina (Dog Rose)

Rubus caesius (European dewberry, wild blackberry)

Corylus avellana (Common hazel) and *Corylus colurna* (Turkish hazel)

Adaptation Measures

Habitat maintenance & restoration

Restoring degraded meadows and open habitats through Cleaning & Mowing

Aims:

- Maintenance of a mosaic of habitats, important for biodiversity.
- Improving habitat suitability for other species in the LCs food chain (grazing opportunities for ungulates).
- Indirectly securing the food needs of LCs.

Cleaning overgrown areas that contain fruit species

- remnants of old orchards, wild fruiting trees.

- Dense vegetation was removed to increase light access and remove competition from other species.
- The crowns of existing fruit trees have been pruned to enhance fruiting.

Pilot site in Chershovitsa, Bulgaria, with applied cleaning measures.

Example from Montenegro

- Areas degraded due to wildfire
- Aim: Restoring the habitat and revitalising the area.

Selective cutting

- Marking and cutting dry, burned or fallen trees.
- All cut trees will be used in the pilot area
 - to create **terraces to stop soil erosion**
 - to accumulate soil and promote the new growth of vegetation.

Pilot sites Horolac and Hridsko lake in Montenegro, before and after cutting measures.

Example from Slovakia

- Aim: **Prevent overgrowth in meadows with high plant biodiversity** and maintain mosaic habitats.
- This traditional mowing technique - implemented as part of the Hand mowing festival in the NP Slovensky Raj.
- **Volunteers and local communities were engaged** in piloting measures with traditional hand scythes.
- Awareness raised for the importance of **traditional agroforestry practices** for sustainable management of habitats.

Main recommendations

Always plant a **variety** of fruit-bearing species to reduce risk of crop failure.

Combine species from different fruiting periods for seasonal diversity

Regular **maintenance** is key feature

Terrace construction using retained timber as a tool for erosion control and creation of regeneration microsites under steep, fire-affected conditions.

Challenges

Administrative delays

Unpredictable weather

Finding saplings

Harsh terrain and difficult access

Equipment failure

Lessons learnt

start earlier and allow additional timeframe for each action, be flexible and creative

always prepare plan B

capacity is needed not only for planting, but also for seed collection, storage and germination, search for and use local knowledge (most in elderly people), be flexible, search for unexpected allies

Choose good equipment

Take feasibility into consideration when choosing the sites

**Thank you your
attention!**

Mentimeter

Type in [menti.com](https://www.menti.com)

Code 1657 1632

Have you used climate change metrics in protected area planning and management?

Do you intend to use climate change metrics for protected area planning and management in the future?

What additional information or capacity on **climate risk assessments** would help you to adapt your park or region more effectively?

Data on species vulnerability

maybe links to the available resources and also probably some trainings how to use them

Better understanding on how species and nature types will be affected

endemic species requirements/ ecology

Analysis how the species can react on climate change

manstraming

mainstreaming in other sectors again :)

Resources (staff and money) time for cooperation cross borders, access to research resultat etc

What additional information or capacity on **climate risk assessments** would help you to adapt your park or region more effectively?

People's willingness to accept change

What are your main gaps and challenges for implementing **climate change adaptation measures** in your park or region?

Sometimes process is time consuming

Lack of time and expertise

Sometimes not much you can do to reduce climate change

good example case studies and advocacy

knowlegde, stuff and also legislative restrictions in PAs, but mainly lack of financial resources

Finances, so that state can look at long term nature manegment

Knowledge gap but also lack of scientific background of authorities responsible for protection planning

interregional cooperation

What are your main gaps and challenges for implementing **climate change adaptation measures** in your park or region?

Resources, collaboration
crossborders and
managers - researchers
